

Why \$2.3 trillion can't deliver ten cents worth of medicine.

In developing countries, two million children die each year from common diarrhea. Even though a 10¢ dose of oral rehydration therapy can cure it. The remedy is cheap and effective — so why can't we get it to those poor people?

According to the Religious Left, rich countries just don't care enough about the poor. Their solution? Government policies that advance a more 'just distribution' of wealth. But, will more money get that lifesaving stuff to the mother in Ghana watching her child die?

Over the past five decades, the 'uncaring' West has pumped \$2.3 trillion into the world's poorest countries; \$500 billion of that from the U.S. Trillions of dollars, yet the bloated, government-run bureaucracies distributing it still can't get desperately poor people what they need.

After 50 years of aid, impoverished countries aren't any better off than they were before. The truth is, all the money in the world can't help, unless we address the root cause of poverty: the absence of economic freedom, and rule of law.

Why throw money at a system that's broken? If you want to make a real difference, visit our website. Together, we can find solutions that deliver.
